

Solution Strategy Document - Template

About this template

A Solution Strategy defines what a solution is in product terms. The customer outcome it delivers. The products and modules that compose it. The workflow that ties them together. The dependencies the solution creates across the portfolio.

It is the seam between the business case for a line of business (which lives in a pitch deck and a business plan) and the product strategies for the components that compose the solution. It does not duplicate either. It does the one thing neither does well: it gives every component team a shared understanding of what the solution is and what they must build, modify, or honor to make it real.

Owned by the GM responsible for the line of business. Senior product, sales, marketing, and finance leadership contribute. Read by executive leadership, the GM's organization, and every product team whose work is part of the solution.

This document is durable substrate. It changes slowly because lines of business change slowly. Minor updates when modules ship or composition shifts. Major updates only when the line of business itself is repositioned. Frequent revisions here destabilize everything below.

Written for two audiences at once. The humans who lead, sell, and build inside the solution. And the agents that will increasingly help plan and execute the work. Both need the same thing from this document: short sections, dense per section, with explicit links upstream to the deck and business plan and downstream to the component product strategies.

For the larger framework this document sits inside, see the Product Development Hierarchy and Document Framework.

Solution Definition

What this solution is, who it's for, and why a customer buys it. Four sections, each doing a distinct job.

Customer Outcome

What does the customer accomplish by buying this? State this as an outcome, not a feature list. "An end-to-end telehealth program their clinic can run without adding staff" is an outcome. "A bundle of five products" is not.

Target Customer

Who is this solution for? Be specific about segment, size, context, and the buying decision. If the solution serves multiple segments differently, name each one and how the solution applies.

Concept

The shared internal definition. One sentence. The test: if a sales rep, a PM, and a customer each described this solution in a sentence, those three sentences should align. This is not marketing copy. It is the definition every team works from so the solution stays one thing instead of fragmenting into three.

Value Proposition

Why a customer parts with money for this. Two to four sentences, or a short list of the punchy claims that drive the sale. This is the language sales, marketing, and product should all be using when they talk about the solution externally.

Two failure modes to avoid:

- **Vague benefit language.** "Streamlines telehealth operations" tells a customer nothing. Replace it with the specific change the solution creates in their economic or operational reality.
- **Feature dumps.** "Includes Scribe, Concierge, and Prepayment" lists what's in the box. The value prop says why those things matter together.

The good version names the customer's reality and the specific change. Example for telehealth: *"A clinic runs a profitable telehealth program with existing staff. Breakeven is 11 visits per month. AI handles the documentation providers hate. One SKU, no tier negotiation."* Specific, falsifiable, sounds like a person rather than a brochure.

Product Impact

A map of every product, module, service, or API the solution depends on. The purpose of this section is to make the full dependency surface visible in one place so nothing gets missed and nothing gets debated twice.

The What and Why columns are quick context — one line each, enough for someone reading this document to understand the shape of each dependency without leaving it. The detailed WHAT lives in the receiving team's PRD. The detailed WHY lives in their Product Strategy. The HOW lives in technical design.

The **Impact Type** column tells the receiving team what kind of work this represents:

- **New** — a product, module, service, or capability that does not exist today and must be built
- **Addition** — meaningful new functionality added to something that already exists
- **Modification** — a change, tweak, or fix to existing behavior
- **Dependency** — the solution relies on this as-is; no work needed beyond awareness

Product / Module / Service	Impact Type	What (brief)	Why (brief)	Owner	Strategy / PRD
[e.g., Visit Concierge]	New module	[Patient routing and triage for inbound telehealth requests]	[The bundle has no entry point without it]	[PM]	[Link]
[e.g., AI Scribe]	Addition	[Auto-trigger from telehealth visit completion]	[Bundled inclusion is a commercial commitment]	[PM]	[Link]
[e.g., EMR]	Modification	[Endpoint to accept telehealth visit metadata]	[Visit data must persist for billing and audit]	[PM]	[Link]
[e.g., Payment Service]	Modification	[Pre-visit payment capture with refund logic]	[Existing service supports post-visit only]	[Tech Lead]	[Link]

[e.g., Identity Service]	Dependen cy	[Used as- is]	[Identity must be establishe d once, per cross- cutting commitme nts]	n/a	n/a
--------------------------------	----------------	------------------	--	-----	-----

A note on completeness. If something is missing from this table, the receiving team has no signal that the solution depends on them. Err on the side of listing dependencies even when no work is required — the absence of a row reads as "this team is not involved," which is itself a statement.

Workflow & Handoffs

How the components fit together to deliver the customer outcome from the customer's perspective. The Product Impact section above tells each team what work they own; this section tells them how their piece fits into the experience the customer actually has.

End-to-End Workflow

Walk through the customer's experience from start to finish. Name the handoffs between components. Where does data flow? Where does the user move from one product surface to another? Where are the seams the customer should never see?

This is not a UX spec or a system diagram. It is the narrative that lets every component team understand where their product sits in the larger flow and what they must hand off cleanly.

Key Handoffs

Handoff	From	To	What Must Be True
[e.g., Patient request to triage]	[Component]	[Component]	[The contract: what data passes, what state is established, what the user

		experience looks like across the seam]
--	--	--

Boundaries

What is and isn't part of this solution. Useful for closing recurring debates with sales, customers, and adjacent product teams.

In Scope

- [Capabilities and outcomes the solution covers]

Out of Scope

- [Capabilities customers might expect that this solution does not deliver. Be explicit about why: another solution covers it, the customer must integrate with a third party, or it is intentionally excluded.]

Adjacent Solutions

- [Other solutions in the portfolio that this solution touches, complements, or is sometimes confused with. State the boundary.]

Solution-Level Objectives & Key Results

The outcomes the solution as a whole is accountable for. Component products and modules will have their own OKRs that ladder up to these. Keep this list short. If everything is a solution-level OKR, nothing is.

Objective 1: [Statement]

Key Result	Target	Timeline
[Measurable outcome at the solution level]	[Specific target]	[Timeframe]
[Measurable outcome at the solution level]	[Specific target]	[Timeframe]

Objective 2: [Statement]

Key Result	Target	Timeline
------------	--------	----------

[Measurable outcome]	[Specific target]	[Timeframe]
----------------------	-------------------	-------------

Open Strategic Questions

Unresolved questions at the solution or line-of-business level. These are higher than Product Strategy open questions, which focus on a single product or module. Solution-level questions affect composition, packaging, GTM, or whether the solution as defined is the right one.

Question	Owner	Impact	Status
[e.g., Should Standalone Telehealth be sold under this solution or as a separate offering?]	[GM / Decision maker]	[Affects composition, GTM motion, and component product roadmaps]	Open / Resolved

This document defines the solution as a line of business and as a composed product offering. For the full business case, see the linked business plan. For the executive narrative, see the linked pitch deck. For component-level strategy, see the Product or Module Strategy linked in the Product Impact section. For specific capability requirements, see the PRDs that ladder up to those Product Strategies.
